## Baby Pig Milk Replacer with Regano®

### *Advanced Nutrition for the Young Pig*

Ralco's Birthright Baby Pig Milk Replacer has really revolutionized milk replacers for baby pigs. Here are some of the differences between Ralco's Birthright Baby Milk Replacer and other milk replacers on the market: Piglets will drink Ralco's Birthright Baby Pig Milk Replacer earlier than most other milk replacers. This is very important because most preweaning mortality is in the first three days. If you are going to save most of those piglets from starving out, they are going to have to drink. Consumption of Ralco's Birthright Baby Pig Replacer by piglets is 30 to 50% higher than most other milks the first week after birth. Piglets that drink Ralco's Baby Pig Milk Replacer will not get nutritional scours because it is easily digested by one-day-old piglet. Piglets that drink Ralco's Baby Pig Milk Replacer will have a feed efficiency of 1:1. Other milk replacers may seem like a better deal because they are cheaper in price, but most of them only get a 1.2 to 1.4 feed efficiency. The smallest pigs thrive on Ralco's Baby Pig Milk Replacer.
